1 in 8

people with cancer

have a risk-causing change in their genes that was passed down from a family member.[1]

Of people with a genetic change,

1 in 3

had their care changed based on their genetics.[1]

Nearly half

of patients with a germline variant

don't have a suggestive family history.

A powerful tool for cancer

Germline genetic testing can benefit all cancer patients as a routine practice in cancer care.
