

CMMC

What GateKeeper Does For You

Auto-Lock Unattended PCs

Protect data with automation, not policy and training. Computers will always lock when users leave.

Enforce the Strongest Passwords

Create long passwords that let users log in password-free and are impervious to brute-force attacks.

Free Up Valuable Resources

Reducing time-wasting password problems allows for more focus on primary goals of the organization.

Avoid Regulatory Violations

Do not rely on policy and training alone to enforce compliance – use automation dwarfs trust in users.

Automated Audit Collection

See who is logged in to which PC and even shared accounts in real-time and scheduled reports.

Prevent Passwords Written Down

Stop users from insecurely writing down passwords with long, difficult-to-guess passwords.

Prevent Human Errors

Human error is the single largest contributing cause of data breaches. Do not wait - prevent.

Defend Against Cyber Attacks

Use tokens to help prevent phishing, keyloggers, shoulder surfing, brute force, account takeover, and more.

Stronger Security for C-Level Staff

Executives are targeted more often by malicious actors and require increased protection.
